

ASSIGNMENT 1

AI-Assisted Policy Review & Approval Assistant

For Allianz Technology training on Azure AI Foundry

Created by Siddhesh Prabhugaonkar

1. Scenario Context

Your organization receives frequent **policy change requests** (HR, IT, Finance, Security). These requests are usually discussed informally in **Microsoft Teams**, leading to:

- Unclear summaries
- Missed approvals
- No structured audit trail

You are asked to build an **AI-assisted Teams solution** that:

- Understands user intent
- Summarizes requests using AI
- Routes approval requests to the right stakeholders
- Posts outcomes back into Teams

The solution must use **Microsoft AI Foundry + Power Automate (use Logic App in place of Power Automate)**, without building a custom Teams app.

2. Business Requirements

Functional Requirements

1. Users interact **only via Microsoft Teams**
2. Messages must support **command-based interaction**:
 - `/ai` → Get AI summary or clarification
 - `/approve` → Trigger approval workflow
3. AI must:
 - Summarize the request clearly
 - Highlight key decision points
4. Approvals must:
 - Be sent as **native Teams approval cards**

- Capture Approve / Reject outcome
5. Final decision must be posted **in the same Teams thread**
-

Non-Functional Requirements

- No Copilot dependency
 - No Bot Framework or custom Teams app
 - Secure API access using Foundry deployment keys
 - Clear separation of:
 - UI (Teams)
 - Orchestration (Power Automate)
 - Intelligence (AI Foundry)
-

3. High-Level Architecture (what learners should design)

```
Microsoft Teams
↓
Power Automate
↓
Azure AI Foundry Prompt Flow
↓
Power Automate (Approvals)
↓
Microsoft Teams
```

4. Assignment Tasks

Task 1 – Prompt Flow (AI Layer)

Create and deploy a **Prompt Flow** in Microsoft AI Foundry with:

Input

```
userMessage (string)
```

Prompt behavior

- Uses Chat API
- System prompt:
 - Acts as an enterprise policy assistant
 - Produces concise, structured summaries

Output

```
output (string)
```

The flow must be **tested and deployed** as an online endpoint.

Task 2 – Teams Trigger & Message Processing

In Power Automate:

1. Create an **Automated cloud flow**
 2. Trigger:
 3. When a new message is added to a chat or channel
 4. Extract message text using:
 - o Get message details
 - o plainTextContent
 5. Use conditions to detect:
 - o /ai
 - o /approve
-

Task 3 – /ai Command Handling

When a message starts with /ai:

1. Strip /ai from the message
 2. Call the **Prompt Flow endpoint** using HTTP
 3. Parse AI response
 4. Post AI output back into Teams as a threaded reply
-

Task 4 – /approve Command Handling

When a message starts with /approve:

1. Strip /approve from the message
 2. Call Prompt Flow to summarize the request
 3. Start a **Teams approval**
 - o Approve / Reject
 - o Assigned to a configured approver
 4. Post approval outcome back into the same Teams thread
-

Task 5 – Error Handling (Moderate Complexity)

Implement **at least one** of the following:

- Graceful error message if AI endpoint fails
- Ignore messages posted by the flow itself

- Reject /approve if message is too short
-

5. Example User Interactions

AI-only request

/ai Please summarize the updated remote work policy

Expected

- AI summary posted in Teams
-

Approval request

/approve Increase cloud infrastructure budget by 20% for Q3

Expected

- AI summary
 - Approval card in Teams
 - Approval result posted in same thread
-
